C.C.P Contact Probes Co., Ltd. was founded in 1986 with the goal "to set new quality standards in the industry and put customer satisfaction at the core of the business."

C.C.P. has started as a specialized provider of test probes and socket auxiliary solutions and has slowly expanded its product portfolio in related industries such as electronic component manufacturing. Our customized manufacturing equipment and strong research team enable us to stay at the forefront of the industry and develop products that reach the highest standards in terms of quality and availability.

After years of continuous growth, C.C.P. went public in 2001 and got listed on the Taiwan Stock Exchange in 2003. As of today, C.C.P. has subsidiaries in the U.S.A., China, Germany, India, Singapore, Japan and Korea, meeting demands from customers around the globe.

Apart from superior product quality, C.C.P. is committed to delivering excellent customer support, fast responses, and engaging customer interaction.

C.C.P. Strengths

Mirror process

Normal

Mirror process

C.C.P. consistently delivers high-quality products by optimizing the production process. The results are extremely durable and reliable products that meet our client's expectations. One of these cutting-edge technologies is called “Mirror Process” which significantly improves the surface quality of the pin tip.

- Less chance for solder migrating
- Less probe cleaning necessary

Tip appearance comparison after 100,000 touchdowns

Normal

Mirror process

C.C.P. Strengths

Plating Line

C.C.P. has its own plating facility and technology. All materials we receive go through a strict quality control and materials used are certified by RoHS. Our plating technology is the result of more than 20 years of in-house research and delivers an industry leading performance for our products.

C.C.P. is specialized in thick-layer Au-plating (over 150u"), blind-hole plating (Aspect Ratio >6.5:1), precious metals processing (Pd alloy), etc.

Advanced Analysis Equipment

Optical Profiler

Surface roughness inspection and measurement.

Nanoindenter

Plating hardness measurement.

FE-SEM

Surface observation with EDS for material analysis.

Product Number Chart

WE BeCu, WJ₃ plated

Manufacturing Procedure

A0 Standard Manufacturing Process
F0 Mirror Process

Structure Type

- 1 Double-active
- 2 Double-active with Ring
- 3 Single-active
- 4 Single-active with Ring

Serial Number

Barrel Outer Diameter

Ex 031 corresponds with barrel OD Φ0.31mm

Barrel Length

Ex 21 corresponds with barrel length 2.1mm

Head Type

Crown

Easily penetrates into solder ball or pad for improved contact.

Conical

60°

Sharper tip to strongly penetrate the oxide or particle on PCB.

Pyramid Crown

Easily penetrates into solder ball or pad with stronger tips for improved contact.

Conical

90°, 120°

Sharper tip to softly penetrate the oxide or particle on PCB.

Serrated

5 Tips

Easily penetrates into solder ball or pad with more contact points than crown type.

Sphere

For avoiding probe mark on PCB. It is usually used in bottom plunger.

Serrated

8 Tips

Usually used for Kelvin Tests that have a very small pitch between the probe tips.

Flat

Mostly used in bottom plunger to avoid scratching PCB gold pad and leaving no marks or indentations.

Serrated

9 Tips

Easily penetrates into solder ball or pad with more contact points than crown type.

Half Moon

Used for Kelvin type. Pointing to ball / pad, half moon tip perfectly aims the testing area.

Cup

Commonly used for testing PGA package types of IC.

Blade

Sharper than half moon tip, blade type is more commonly used in Kelvin pin as for standard types.

General Final Test

C.C.P. has over 25 years of experience in the development and manufacturing of sockets and pins. Our research and development teams are constantly improving the materials and manufacturing process to offer our customers the best solutions. We have developed more than 300 customized pins and over 50 special pins that are designed to withstand high currents, high-temperature environments or can handle high frequency data transmission.

Wafer-Level CSP Test

With the massive growth of WLCSP in the semiconductor market, C.C.P. has designed over 30 different kinds of probe heads to meet the demand of the market. A pogo pin design improves the durability of the probe head. Additionally, coplanarity errors induced by differently sized solder balls can be avoided by our pogo pins which have a working travel designed for 250um. We offer a wide variety of head types to meet our client's needs.

Design Concept

8 balls, pitch 0.5mm

C.C.P. employs a combination of industry-leading high precision machines from renowned manufacturers as well as custom made equipment. This allows us to drill holes smaller than $\Phi 60\mu\text{m}$.

High Current Solutions

C.C.P. offers a patented solution for high current pogo pin testers that can be used in a variety of applications such as EV Battery testing or other industrial applications. The design is customizable and can be fitted to your specific requirements. The design offers a much more reliable current flow and reduces the wear on the tester significantly.

Design Concept

Double-Ended High Current Probe for IC Testing

Current Path of...

Normal pin: Blue line

High current pin: Red line

Taiwan Patent No. M453149

Generally, the current runs from the bottom plunger through the barrel wall to the top plunger. Due to that, the contact resistance between the wall and plunger will increase gradually. This can cause the spring to burn and lead to a failure at higher currents. The straight plunger in the center of the high current pin allows the current to take a direct route, to the top plunger and in consequences avoids flowing through the spring during testing.

Single High Current Pin for Lithium Battery Testing

CCP developed a special design which is different from standard testing pins to improve the current carrying capabilities of our high current pin.

Coaxial High Current Pin for Lithium Battery Testing

This coaxial high current pin combines a sensor pin with a current test pin in one probe design. The one-piece design of the current test pin improves the electrical resistance significantly.

Application Demonstration

We are able to customize our probes to meet your current carrying requirements. Several patented designs and proprietary, industry leading plating technologies will offer you the right solution for your application.

High Frequency Solutions

High frequency testing is mostly used for radio-frequency channels and wide-band transaction applications. The signal pin can be customized according to the electrical characteristics and testing environments of the client. For IC testing, we usually recommend ultra-short pins, coaxial probes, and PCRs to accommodate the different types of ICs.

Design Concept

We have the ability to simulate 3D electromagnetic performance as well as S-parameters, inductance and impedance and by that improving SI characteristics.

Performance Simulation

CCP utilizes HFSS to simulate the pin performance in the sockets. This allows us to choose the best pin before designing a customized sockets.

CCP has a dedicate high frequency lab that uses TDR, network analyzers and RF probe stations to measure the socket / pins actual performance and thereby verifying the simulation results. These are all indispensable equipments for developing new high-class products.

Kelvin Contact Solutions

The term Kelvin Contact is derived from the English physicist Lord Kelvin who invented the Kelvin Bridge in 1861. The Kelvin Bridge is used to measure unknown electrical resistors below 1Ω and is a modification of the Wheatstone bridge. The Kelvin contact solution by C.C.P. is using one of the pins to measure the current while the other is adjusting the applied voltage. As with all our products our engineers will adjust the product according to your specific needs.

Design Concept

Kelvin Contact

Kelvin Contact is mostly used to test specific electrical signals, as well as be the route of current bypass when testing. C.C.P. innovated several types of kelvin pins to meet market demands.

Available in 70um~100um kelvin gap, allows precise contacts to balls / pads.

Different type of tip for various application

Blade Tip Ladder Tip Half Moon Tip Crown Tip

- Blade: Common tip type for kelvin testing
- Ladder: Similar with blade type but more accurate positioning
- Half Moon: Mostly applied in QFN, QFP
- Crown: No need to take the direction into account when manufacturing the socket and inserting the pins as each claw can prick the testing area.

Memory Test Solutions

Memory ICs are a core component of nearly every electronic device. Memory ICs are usually categorized in volatile and non-volatile memory where volatile memory keeps its stored information when the power cycle is interrupted and volatile memory needs a constant power supply to retain its data. Most memory modules have a standardized format that can be tested with standardized test-pins. C.C.P. offers testing solutions for all common formats (DDR, Flash, eMCP, etc.) as well as customized testing solutions for your individual needs.

Burn In Test

The Burn-In test will expose the DUT (device under test) to harsh conditions: 150°C; relative humidity (RH): 85 rh; current rating: 1A continuous for 1000 hrs. In order to withstand conditions like that, C.C.P. modifies the plating material and core material. C.C.P. splits the socket into two parts: The standard part and the machining part. The standard part is manufactured by insert molding and holds the machining part which is customized according to the customers' IC design and made by CNC. The pins for the burn-in solution use a special material (WJ3) that shows an exceptional hardness and is able to withstand the demanding conditions posed by the Burn-In test.

Design Concept

Pogo Type Burn-in Socket

Burn in Socket	Specification
IC Size	<15x15 mm ²
Min. Pitch	0.3
Body Material	PES (Black)
Housing Material	Ultem2300
Operating Temperature	-55°C~180°C

C.C.P. splits the socket into a standard part and a machining part. The standard part is processed by insert molding while the machining part is manufactured by CNC according to IC's size. This shortens the development time and reduces the mold tooling cost. C.C.P. can customize the sockets according to your needs.

Standard Part

Customized part
Manufactured according to IC size

Plating / Raw Material

Commonly used in burn in test solution, WJ3 is a special plating material developed by C.C.P. and usually plated on the DUT side plunger. Besides high hardness, WJ3 is able to perform steadily in severe testing environments that reach 150°C for 1000 hours possibly even for 3000 hours.

Fin Pitch Conn. / FPC Test

A board to board connection requires fine-pitch pogo sockets to achieve the required accuracy. Pogo-Pin testing solutions have a significantly increased lifetime with more than 300,000 touchdowns. The excellent connectivity reduces the coplanarity error that occurs with traditional testing pins and results in improved efficiency of the testing procedures. C.C.P. has developed different kinds of testing pins that can be customized according to the customer's needs.

Design Concept

Panel Test

Most electronic devices use displays to interact with the user. Those displays are often fragile which requires appropriate testing solutions. Pogo pins are especially suitable for this type of application due to their customized tip, which protects the DUT from scratches.

Design Concept

Panel Pin Housing

Panel Test Housing

The housing is installed on a test head which contacts the panel directly. To protect the panel from damage, the head is rounded which prevents scratching of the panel surface.

Panel Pin Housing	Specification
Min. Pitch	0.45 mm
Panel Size	50"~85"
Housing Material	Peek
Life Time (Pin)	>200,000

B type

E type

D type

Panel Pin Head Type

A conical tip is able to puncture oxide layers and has a low chance to leave scratches on the display. We usually recommend the D type for panel tests, to eliminate the chance of scratches.

ATE Connection

Pogo towers and adapters are usually used to connect a motherboard and a daughterboard in automatic testing equipment. C.C.P. has developed ATE connecting solutions for several years. Testing equipment such as J750 and V93000 are well-established solutions.

Design Concept

A pogo tower can be customized according to you requirements such as frequency or pitch.

Pogo tower (line)

Probe Cleaning

Particles can interfere with the test result and decrease the yield rate. Probe cleaning can avoid this situation from happening. We can provide various cleaning tooling for persistent solder splashes or particles on the probe tip.

Slightly brush the probe tip to remove particle or tin on it.
